

ABSTRACT

Process for transmitting data between data processing means and a radio communication network and module and mobile terminal for implementing the process.

The terminal implements a process for transmitting data between a radio communication network (39), transmitting the data at a specified rate, and data processing circuits (40; 95) linked to the network (39) by the terminal (10, 11, 30) comprising network interface radio circuits (30) linked to data adapter circuits (86, 96) interposed between the radio circuits (30) and the data processing circuits (40; 95) so as to adapt them to the network (39), in which the data flow under the control of sequencer circuits (8), the sequencer circuits (8) being locked to the rate of the network (39) so as to synchronize with the latter the flow of the data through the adapter circuits (86, 96).
